

## Ultrasound Lipo Cavitation – Fat Destruction

A Lipo Cavitation procedure only targets the fat cells. When ultrasonic waves are directed to the area of fatty tissue you want to remove, they damage the fat cell membranes. Because the device is calibrated only to target fat cells, no other damage will occur to surrounding tissues or organs. During the procedure, ultrasonic waves begin to break down the fat cells being targeted. This causes them to release triglycerides and other fatty substances that are a key component of the flabby tissue.

During the week after a Lipo Cavitation treatment, your body will process these and remove them from the body via the lymphatic system.
